

## Erasmus - QualiProSH Electro

### Project summary

**Role R.U.S.Z: project partner; Project duration: 2014-2016**

The QualiProSH Electro project involves partners from five European countries. The aim of the project was the development of three business field specific modules and two modules for the teaching of required social competence, as well as the combination of these five new modules and five already completed modules from the predecessor project QualiProSH II to an overall qualification as "Specialist for Waste Electrical Equipment". Subsequently, the qualification was adapted, implemented, tested and optimized by the partners to the framework of the partner countries. Based on the results, a generally uniform Europe-wide qualification concept was developed for transfer to all EU countries. The essential contents of the 10 modules were also prepared as webinars to offer the possibility of teaching parts via the Internet.

By introducing a Europe-wide uniform, business field-specific and work process-related quality standard, new employment prospects were to be created on the labor market and the mobility of employees was to be improved through the comparability of their skills and knowledge. In addition to the development of the qualification, the project also included the development of an assessment tool to identify the qualification needs in the business field based on a similar tool developed in the previous project.
