

Learning Workshop for Sustainable Environmental Protection

The project "Learning Workshop for Sustainable Environmental Protection" develops and tests innovative learning workshops in 5 occupational fields. They are intended to address sustainable environmental and climate protection in vocational education and training.

These job-specific 5 learning workshops are based on a general concept that is developed in the project. For this purpose, a qualification concept for the teaching staff, who train in the learning workshops, as well as quality standards for this qualification concept are created. This ensures that not only field-tested concepts for learning workshops are available, but also that personnel can be trained for them, who are qualified according to the same standards throughout Europe.

The project as a whole strives for a holistic portfolio of results that can be used in both vocational education and training.

In the project, 6 partners from 5 member states of the European Union work together for 2 years. They come from Poland, Austria, Slovenia, Spain and Germany and are vocational training institutions and socio-economic training providers and companies.

The project will run from March 2022 to February 2024.
